

# Econ 133 – Global Inequality and Growth

## What is Capital?

Ludvig Wier

[ludvig.wier@berkeley.edu](mailto:ludvig.wier@berkeley.edu)

## Roadmap

1. Capital and wealth: definitions
2. The wealth/income ratio in the long-run
3. The link between capital income and wealth

# What is wealth?

# What drives wealth?

# Why do we care about wealth and capital?

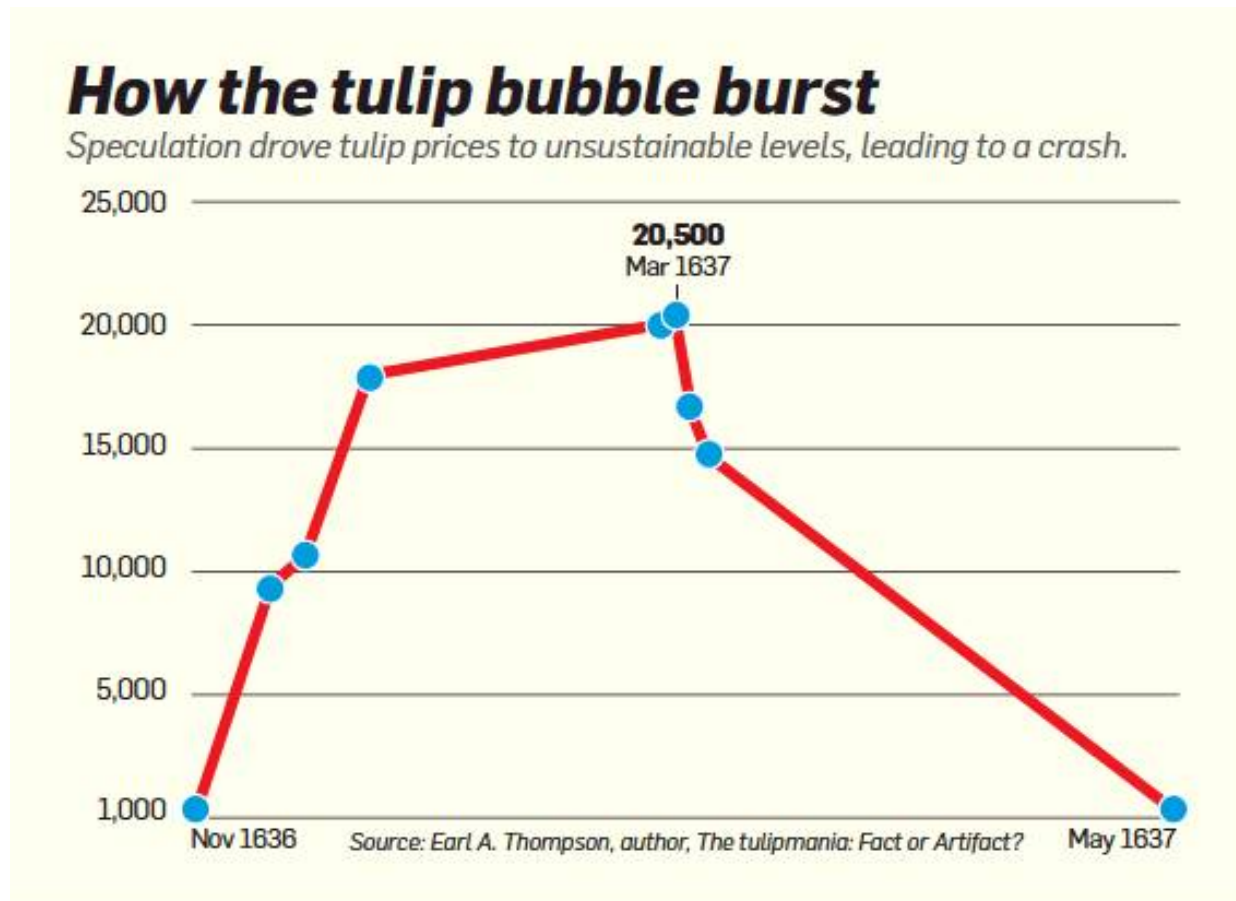

## Why do we care about wealth and capital?

Wealth is not interesting in isolation - but paramount to understand:

- The relative importance capital and labor
- The importance of wealth inequality
- The importance of wealth inequality for income inequality

## Why do we care about wealth and capital?

# 1 Capital and wealth: definition

## 1.1 Private wealth

- Private wealth  $W$  = assets – liabilities of households
- Assets = all non-financial (housing, land...) and financial assets (equities, bonds, bank deposits...)
- Recorded in national balance sheets at *market prices*

# What determines market prices?

## 1.2 Public wealth

- Public wealth = assets – liabilities of the government
- Liabilities = public debt; assets = schools, roads, barracks...

## 1.3 National wealth

- National wealth = private wealth + public wealth

National wealth can be decomposed as follows:

- National wealth = domestic capital  $K$  + net foreign assets
- $K$  = domestic capital = land + housing + other domestic capital
- At world level: wealth = capital
- Key reference for data on wealth and its composition: World Inequality Database, <http://wid.world>

## 2 The wealth/income ratio in the long run

Object of interest  $\beta = W/Y$

### 2.1 Data sources

- Long tradition of national wealth estimates in Britain (Petty, King, Giffen) and France (Vauban, Lavoisier, Colson) in 18th-19th cent.
- Not sufficiently precise to study short-run fluctuations; but fine to study broad orders of magnitudes and long-run evolutions

### The changing nature of national wealth: UK 1700-2010

Source: Piketty and Zucman (2014). National wealth = agricultural land + housing + other domestic capital goods + net foreign assets

### The changing nature of national wealth: France 1700-2010

Source: Piketty and Zucman (2014). National wealth = agricultural land + housing + other domestic capital goods + net foreign assets

# Why the rapid reduction in wealth from 1910-20?

## 2.2 The long-run driver of wealth = savings

Price effects (=capital gains) tend to be insignificant in the long run  
→ savings main driver of wealth

<b>Gross and net saving in rich countries, 1970-2010</b>			
	Gross private savings (% national income)	Minus: Capital depreciation	Equal: Net private saving
U.S.	18.8%	11.1%	<b>7.7%</b>
Japan	33.4%	18.9%	<b>14.6%</b>
Germany	28.5%	16.2%	<b>12.2%</b>
France	22.0%	10.9%	<b>11.1%</b>
U.K.	19.7%	12.3%	<b>7.3%</b>
Italy	30.1%	15.1%	<b>15.0%</b>
Canada	24.5%	12.4%	<b>12.1%</b>
Australia	25.1%	15.2%	<b>9.9%</b>

A large part of gross saving (generally about half) corresponds to capital depreciation; i.e. it is used solely to repair or replace used capital.

Sources: Piketty and Zucman (2014)

<b>Private and public saving in rich countries, 1970-2010</b>			
	<b>National saving (private + public) (net of depreciation) (% national income)</b>	<b>incl. Private saving</b>	<b>incl. Public saving</b>
U.S.	<b>5.2%</b>	7.6%	-2.4%
Japan	<b>14.6%</b>	14.5%	0.1%
Germany	<b>10.2%</b>	12.2%	-2.0%
France	<b>9.2%</b>	11.1%	-1.9%
U.K.	<b>5.3%</b>	7.3%	-2.0%
Italy	<b>8.5%</b>	15.0%	-6.5%
Canada	<b>10.1%</b>	12.1%	-2.0%
Australia	<b>8.9%</b>	9.8%	-0.9%

A large part (variable across countries) of private saving is absorbed by public deficits, so that national saving (private + public) is less than private saving.

Sources: Piketty and Zucman (2014)

## 2.3 The long-run wealth-income ratio: $\beta = s/g$

In the long-run, the wealth to income ratio  $\beta$  is equal to the ratio of the *net* saving rate  $s$  by the growth rate  $g$

Proof of the formula  $\beta = s/g$  :

- $W_{t+1} = W_t + s_t Y_t$
- Divide both sides by  $Y_{t+1} = Y_t(1 + g_t)$  to get:

$$\beta_{t+1} = \frac{W_t + s_t Y_t}{Y_t(1 + g_t)} = \frac{\beta_t + s_t}{1 + g_t}$$

In steady state:

- $\beta_t = \beta_{t+1}, s_t = s, g_t = g$
- Plug in above equation, solve for  $\beta$ , and get  $\beta = s/g$

## Intuition?

When savings are large wealth is accumulated  $\rightarrow$  wealth divided by income increase

When income growth is large old wealth as a share of income falls

In the long-run the the rate of wealth accumulation  $s$  relative to income generation  $g$  determines the wealth-to-income ratio

Ex: if  $s = 10\%$  and  $g = 3\%$  then  $\beta = 333\%$

Ex: If  $s = 10\%$  and  $g = 1.5\%$  then  $\beta = 666\%$

Only assumption:  $W_{t+1} = W_t + s_t Y_t$ , i.e., no price effects

**Figure 7b: Observed vs. predicted national wealth / national income ratios (2010)**

## What does this mean for policy?

Imagine a society with 10 percent growth rate versus 0 percent growth:  
What anti-inequality policies matters the most?

Consider an economy where there is no income growth ( $g = 0\%$ ) and people save at a rate of  $s = 1\%$ . Then:

A — The wealth-income ratio will tend to 100% in the long-run

B — The wealth-income ratio will tend to 0% in the long run

C — The wealth-income ratio will tend to 1% in the long run

D — The wealth-income ratio will tend to infinity in the long run

## 2.4 Where does $s$ come from?

Different reasons why people save:

- Precautionary saving
- Life-cycle saving
- Leaving bequests
- Wherever  $s$  comes from,  $\beta = s/g$  if no price effect

## 2.5 What does the $\beta = s/g$ formula say?

Any  $\beta$  possible in steady-state, as  $s$  and  $g$  vary for lots of reasons

Countries with low  $g$  tend to have high  $\beta$

Explains why 18th century economies had high  $\beta$

Explains Europe vs. US

Explains high Chinese saving rate

## 2.6 What does $\beta = s/g$ not say ?

You have a house - that house is now worth twice as much

## 2.7 Change in the market power of capital

- So far we assumed perfect competition: capital and labor are paid their marginal product
- What if capital is paid more (or used to be paid less) than its marginal product?
- Possible channels: decline of unions, globalization, rise of network industries (Facebook, Twitter), change of social norms
- Evidence of change in market power for capital: rise of Tobin's Q

**Figure 5.6. Market value and book value of corporations**

Tobin's Q (i.e. the ratio between market value and book value of corporations) has risen in rich countries since the 1970s-1980s. Sources and series: see [piketty.pse.ens.fr/capital21c](http://piketty.pse.ens.fr/capital21c).

## 2.8 Lessons of $\beta = s/g$ for the 21st century

Population growth will fall  $\rightarrow$   $\beta$  might become high at global level

If in addition productivity growth falls,  $\beta$  might become very high

Are high  $\beta$  a good thing or a bad thing?

- Good: capital is useful (e.g., infrastructure, houses, etc).
- Problem: might exacerbate inequality

### Private wealth / national income ratios 1970-2010

Source: Piketty and Zucman (2014). Authors' computations using country national accounts. Private wealth = non-financial assets + financial assets - financial liabilities (household & non-profit sectors)

### 3 The link between capital income and wealth

- Define  $r$  = average rate of return to wealth =  $Y_K/W$
- **Basic accounting law:**  $\alpha = r \times \beta$
- Typical values:  $\beta = 600\%$ ,  $r = 5\%$ ,  $\alpha = 30\%$
- In practice, average rate of return to capital  $r$  varies a lot across assets and over individuals
